

Réaliser administration

Fedor

: Réalisé par -

Boutarfa Younes

Samedi 06/04/2013 20 :06

Méthode 1 , non permanente

```
[youna@localhost ~]$ su -  
Password:  
[root@localhost ~]#PATH=$PATH:/sbin
```

Méthode 2 permanent

```
[youna@localhost ~]$ su -  
Password:  
[root@localhost ~]#  
[root@localhost ~]# ls -al  
total 200  
drwxr-x--- 7 root root 4096 jan 3 16:04 .  
drwxr-xr-x 23 root root 4096 jan 3 15:54 ..  
-rw----- 1 root root 1087 jan 3 15:45 anaconda-ks.cfg  
-rw-r--r-- 1 root root 24 déc 3 2004 .bash_logout  
-rw-r--r-- 1 root root 191 déc 3 2004 .bash_profile  
-rw-r--r-- 1 root root 176 déc 3 2004 .bashrc  
-rw-r--r-- 1 root root 100 déc 3 2004 .cshrc  
,  
,  
[root@localhost ~]# gedit .bash_profile  
# .bash_profile  
# Get the aliases and functions  
if [ -f ~/.bashrc ]; then  
    . ~/.bashrc  
fi  
# User specific environment and startup programs  
PATH=$PATH:$HOME/bin:/sbin  
export PATH  
unset USERNAME  
[root@localhost ~]# source ~/.bash_profile
```

Configuration statique des interfaces réseau

1) Configuration statique non permanente

ifconfig {nom-interface} {adresseIP} netmask {masque}
exemple:

```
ifconfig eth0 192.168.1.1 netmask 255.255.255.0 up
```

2) Configuration statique permanente

- ✓ **éditer le fichier ifcfg-eth0**

méthode1

```
gedit /etc/sysconfig/network-scripts/ifcfg-eth0
```

méthode2

```
[youna@localhost ~]$ cd /etc/sysconfig/network-scripts/
[youna@localhost ~]$ ls
[youna@localhost ~]$ vi ifcfg-eth0
```

fichier par défaut

```
DEVICE=eth0
BOOTPROTO=dhcp
ADDR=00:0C:29:92:8C:C8
ONBOOT=yes
TYPE=Ethernet
```

Après la modification

```
DEVICE=eth0
BOOTPROTO=static
IPADDR=192.168.40.1
NETMASK=255.255.255.0
GATEWAY=192.168.40.1
NETWORK=192.168.40.0
ADDR=00:0C:29:92:8C:C8
ONBOOT=yes
TYPE=Ethernet
```

3)méthode configuration graphique de l'adresse ip

Environnement de bureau ---> paramètre de système --> réseau --> modifier --> configuration statiquement

- ✓ pour redémarrer service de la carte réseau :

```
[root@localhost ~]# service network restart
```

Installation de dns + creation des zones (direct et inverse)

```
[root@server RPMS]# cd /media/cdrecorder/Fedora/RPMS
```

```
[root@server RPMS]# find bind*
```

- ✓ **Pour installer le dns taper :**

```
[root@server RPMS]# rpm -ivh bind-9.3.1-4.i386.rpm
```

- ✓ **pour verifier si un package est déjà installé :**

```
[root@server RPMS]# rpm -q bind-9.3.1-4.i386.rpm
```

éditer fichier de configuration DNS :

```
[root@server RPMS]# gedit /etc/named.conf
```

• Zone de recherche directe

```
zone "tri.ma" IN { // la zone tri.ma
    type master ; // c'est une zone premiere
    file "tri.ma.zone" ; // le chemin du fichier de zone
};
```

- **Créer un fichier :**

```
[root@server named]# gedit tri.ma.zone
```

- ✓ **Copier le contenu de “localhost.zone” dans “tri.ma.zone”**

```
[root@server named]# cat localhost.zone > tri.ma.zone
```

✓ **Editer Le fichier de zone :**

```
[root@server named]# gedit tri.ma.zone
```

```
$TTL 86400
@ IN SOA serveur.tri.ma. root.tri.ma. (
        42 ; serial (d. adams)
        3H ; refresh
       15M ; retry
       1W ; expiry
      1D ) ; minimum

        IN NS      serveur.tri.ma.
serveur.tri.ma.    IN A 192.168.4.1
c1.tri.ma.         IN A 192.168.4.2
c2.tri.ma.         IN A 192.168.4.3
www               IN CNAME serveur.tri.ma.
```

✓ Ajouter les lignes suivantes au fichier [/etc/resolv.conf](#)

La ligne search précise dans quel domaine effectuer les requêtes DNS.

La ligne nameserver précise l'adresse IP du serveur DNS

```
[root@server named]# gedit /etc/resolv.conf
```

```
search tri.ma
nameserver 192.168.4.1
nameserver 172.0.0.1
```

✓ **Il faut alors relancer le service named à l'aide de la commande :**

```
[root@server named]# service named start
```

```
Démarrage de named : [ OK ]
```

I La commande NSlookup :

La commande NSlookup permet de diagnostiquer et d'interroger en mode interactif le serveur DNS,

Elle permet aussi de visualiser tous les enregistrements d'une zone.

```
[root@server named]# nslookup
```

```
> c1.tri.ma
Server: 192.168.4.1
Address: 192.168.4.1#53

Name: c1.tri.ma
Address: 192.168.4.2
>
```

```
[root@server named]# gedit /etc/sysconfig/network
```

✓ **Le fichier hosts :**

Le fichier host est un fichier qui se trouve dans chaque machine disposant de sa propre base de données de noms qui contient les mappages entre les noms et les adresses IP : Sur des réseaux importants, cette base de données dupliquée n'est pas simple à maintenir.

Dans Linux le fichier hosts se trouve dans le répertoire suivant : </etc/hosts>

Pour configurer le fichier hosts :

Ouvrez le fichier.

Saisissez les lignes faisant correspondre l'adresse ip au nom d'hôte.

```
[root@server named]# gedit /etc/hosts
```

✓ Ajouter les lignes suivantes au fichier </etc/resolv.conf>

La ligne search précise dans quel domaine effectuer les requêtes DNS.

La ligne nameserver précise l'adresse IP du serveur DNS

```
[root@server named]# gedit /etc/resolv.conf
```

18/01/2013

✓ **Zone de recherche inverse**

```
[root@server ~]# gedit /etc/named.conf
```

```
zone "4.168.192.in-addr.arpa" IN {  
    type master;  
    file "tri.ma.youna";  
    allow-update { none; };  
};
```

```
[root@server ~]# cd /var/named/
```

```
[root@server named]# touch tri.ma.youna
```

```
[root@server named]# more localhost.zone > tri.ma.youna
```

Editer Le fichier de zone :

```
[root@server named]# gedit tri.ma.youna
```

```
$TTL 86400
@ IN SOA server.tri.ma. root.tri.ma. (
        42 ; serial (d. adams)
        3H ; refresh
        15M ; retry
        1W ; expiry
        1D ) ; minimum

1 IN NS      server.tri.ma.youna.
2 IN PTR      server.tri.ma.youna.
2 IN PTR      c1.tri.ma.youna.
```

```
[root@server named]# service named restart
```

```
[root@server named]# service named start
```

```
[root@server named]# nslookup
```

```
> 192.168.4.1
Server:    192.168.4.1
Address:   192.168.4.1#53

1.4.168.192.in-addr.arpa    name = server.tri.ma.
```

Configuration de serveur primaire et secondaire

- ✓ Dans le server secondaire :

- ✓ methode1:

```
[youna@server ~]$ ls -l /var
```

```
[root@server ~]# ls -l /var/named
```

```
[root@server ~]# chmod g+w /var/named
```

```
[root@server ~]# ls -l /var
```

```
drwxr-xr-x 2 root root 4096 mai 23 2005 local
drwxrwxr-x 4 root lock 4096 jan 31 16:48 lock
drwxr-xr-x 9 root root 4096 jan 31 16:51 log
lrwxrwxrwx 1 root root 10 jan 3 15:34 mail -> spool/mail
drwxr-x--- 4 root named 4096 jan 31 17:19 named
drwxr-xr-x 2 root root 4096 mai 23 2005 nis
drwxr-xr-x 2 root root 4096 mai 23 2005 opt
.
```

```
[root@server ~]# chmod g+w /var/named
```

```
[root@server ~]# service named restart
```

```
Arrêt de named : [ OK ]
```

```
^[[ADémarrage de named : [ OK ]
```

```
[root@server ~]# service dhcpcd restart
```

```
Internet Systems Consortium DHCP Server V3.0.2
```

```
Copyright 2004 Internet Systems Consortium.
```

```
All rights reserved.
```

```
For info, please visit http://www.isc.org/sw/dhcp/
```

```
Arrêt de dhcpcd : [ OK ]
```

```
Démarrage de dhcpcd : [ OK ]
```

```
[root@server ~]# ls /var/named/
```

```
data ista-bz.ma.youna.jnl ista-bz.ma.zone.jnl named.broadcast
named.local
ista-bz.ma.youna ista-bz.ma.zone localdomain.zone named.ca
named.zero
ista-bz.ma.youna~ ista-bz.ma.zone~ localhost.zone named.ip6.local
slaves
```

✓ **methode2 :**

✓ **dans le server primaire:**

```
[root@server2 named]# gedit /etc/named.conf
```

```
zone "efm.ma" IN {           // la zone tri.ma
    type master ;           // c'est une zone premiere
    file "efm.ma.zone" ;    // le chemin du fichier de zone
    Allow-transfer{192.168.10.20;} ; // adresse de server secondaire
};
```

✓ **Dans le server secondaire :**

```
[root@server2 named]# gedit /etc/named.conf
```

```
zone "efm.ma" IN {           //Nom de zone
    type slave;              // type de serveur : secondaire
    file "slaves/efm.ma.zone"; // fichier de zone
    masters {192.168.10.10;} ; // l'adresse Ip du serveur primaire
    allow-update { none; } ;   // mise à jour DNS
};
```

```
[root@server2 named]# service named restart
```

✓ Pour verifier si le fichier de la zone si copier ou non dans server *secondaire*

```
[root@server2 named]# ls /var/named/slaves/
```

```
efm.ma.zone
[root@server2 named]#
```

```
[root@server2 named]# nslookup
```

```
> server.efm.ma  
Server: 192.168.10.20  
Address: 192.168.10.20#53
```

```
Name: server.efm.ma  
Address: 192.168.10.10  
>
```

Configuration de dhcp

8/2/2013

```
[root@server RPMS]# cd /media/cdrecorder/Fedora/RPMS
```

```
[root@server RPMS]# find dhcp*  
dhcp-3.0.2-12.i386.rpm  
dhcp-devel-3.0.2-12.i386.rpm  
dhcpcv6-0.10-13.i386.rpm  
dhcpcv6_client-0.10-13.i386.rpm
```

✓ Pour installer le package dhcp :

```
[root@server RPMS]# rpm -ivh dhcp-3.0.2-12.i386.rpm  
attention: dhcp-3.0.2-12.i386.rpm: Entête signature V3 DSA: NOKEY, key ID 4f2a6fd2  
Préparation... ##### [100%]  
1:dhcp ##### [100%]  
[root@server RPMS]#
```

✓ pour vérifier :

```
[root@server RPMS]# rpm -q dhcp-3.0.2-12.i386.rpm  
le paquetage dhcp-3.0.2-12.i386.rpm n'est pas installé  
[root@server RPMS]#
```

✓ copier le fichier ..

```
[root@server dhcp-3.0.2]# cd /usr/share/doc/dhcp*  
[root@server dhcp-3.0.2]# gedit dhcpcd.conf.sample  
[root@server dhcp-3.0.2]# cp dhcpcd.conf.sample /etc/dhcpcd.conf  
[root@server dhcp-3.0.2]# gedit /etc/dhcpcd.conf
```

ddns-update-style interim;

```

ignore client-updates;

subnet 192.168.3.0 netmask 255.255.255.0 {

# --- default gateway
    option routers                  192.168.3.1;
    option subnet-mask               255.255.255.0;

    option nis-domain      "domain.org";
    option domain-name     "tubtechno.ma";
    option domain-name-servers 192.168.3.1;

    option time-offset      -18000;    # Eastern Standard Time
#
    option ntp-servers      192.168.1.1;
#
    option netbios-name-servers 192.168.1.1;
#
# --- Selects point-to-point node (default is hybrid). Don't change this unless
# -- you understand Netbios very well
#
    option netbios-node-type 2;

range dynamic-bootp 192.168.3.6 192.168.3.254;
default-lease-time 21600;
max-lease-time 43200;

# we want the nameserver to appear at a fixed address
host ns {
    next-server marvin.redhat.com;
    hardware ethernet 12:34:56:78:AB:CD;
    fixed-address 207.175.42.254;
}
}

```

[root@server ~]# service dhcpcd start

Démarrage de dhcpcd :

14/02/2013

❖ **Server :**

afficher les enregistrement de dhcp

[root@server ~]# gedit /var/lib/dhcp/dhcpcd.leases

❖ **Client :**

Sous linux ça ne va pas marcher car les machines linux n'envoient pas leur nom de machine par défaut

Pour résoudre ce problème il faut créer un fichier appelé **dhclient.conf**. Le fichier doit être dans la directive /etc

; « Ce fichier contiendra au moins cette ligne : **send host-name « nom_machine**

: Example

créer un fichier :

```
[root@server2 ~]# touch /etc/dhclient.conf
```

```
[root@server2 ~]# gedit /etc/dhclient.conf
```

```
send host-name "client2";
```

✓ pour vérifier si le client est membre dans le domaine ou non :

```
[root@server2 ~]# cat /etc/resolv.conf
```

```
; generated by /sbin/dhclient-script
search tubtechno.ma
nameserver 192.168.3.1
[root@server2 ~]#
```

Example 2 :

```
[root@server2 network-scripts]# cat /etc/resolv.conf
; generated by /sbin/dhclient-script
search tubtechno.ma
nameserver 192.168.3.1
[root@server2 network-scripts]# echo 0 > /etc/resolv.conf
[root@server2 network-scripts]# cat /etc/resolv.conf
0
[root@server2 network-scripts]# cat > /etc/resolv.conf
[root@server2 network-scripts]# cat /etc/resolv.conf
[root@server2 network-scripts]# dhclient -r
```

```
[root@server2 network-scripts]# dhclient
[root@server2 network-scripts]# cat /etc/resolv.conf
; generated by /sbin/dhclient-script
search tubtechno.ma
nameserver 192.168.3.1
[root@server2 network-scripts]#
```

❖ **Server :**

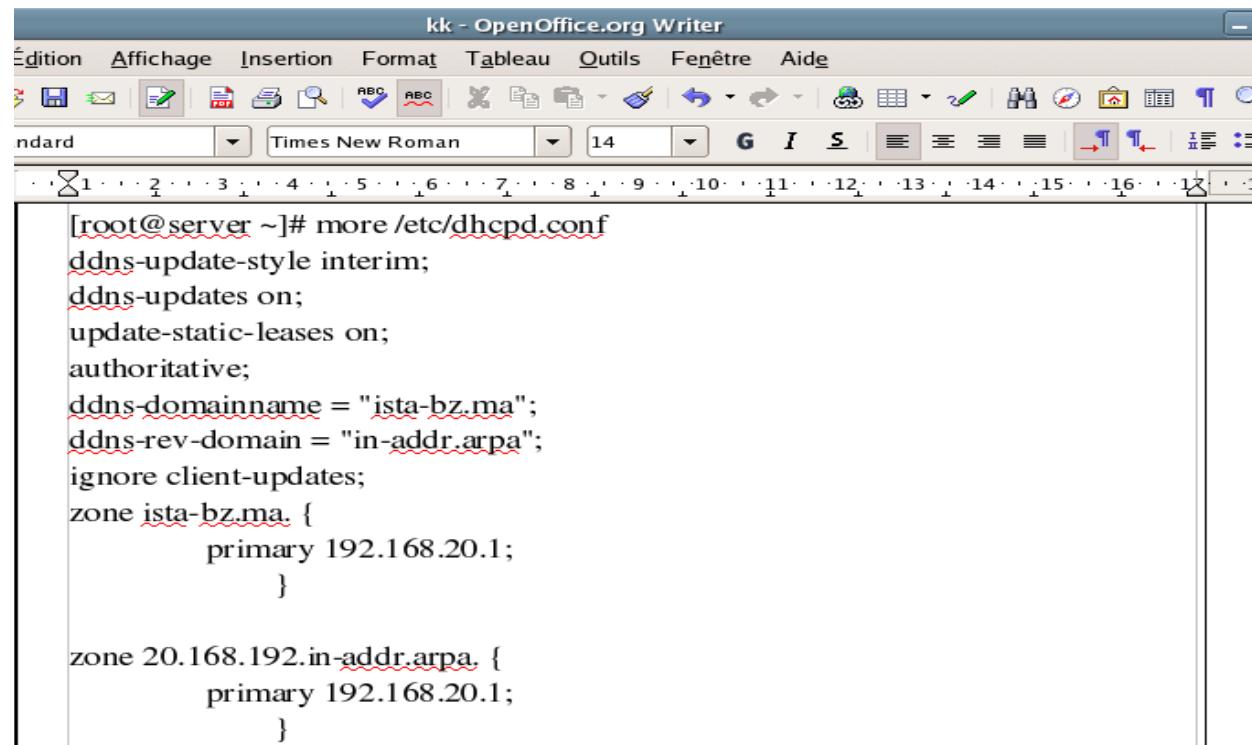

✓ Configurer le serveur DHCP pour faire les mises à jour dynamiques de DNS.

Pour cela ; vous devez modifier les deux fichiers de configuration **/etc/named.conf** et **/etc/dhcp.conf**

Pour le fichier /etc/named.conf :

```
zone "ista-bz.ma" in {  
    type master ;  
    file "ista-bz.ma.zone" ;  
    allow-update { 192.168.20.1 ; } ; // l'adresse de serveur DNS  
}
```

: Pour le fichier /etc/dhcpd.conf

The screenshot shows a document window titled "kk - OpenOffice.org Writer". The menu bar includes "Édition", "Affichage", "Insertion", "Format", "Tableau", "Outils", "Fenêtre", and "Aide". The toolbar below has various icons for file operations, text styling, and tables. The main content area displays the following DHCPD configuration:

```
[root@server ~]# more /etc/dhcpd.conf  
ddns-update-style interim;  
ddns-updates on;  
update-static-leases on;  
authoritative;  
ddns-domainname = "ista-bz.ma";  
ddns-rev-domain = "in-addr.arpa";  
ignore client-updates;  
zone ista-bz.ma {  
    primary 192.168.20.1;  
}  
  
zone 20.168.192.in-addr.arpa {  
    primary 192.168.20.1;  
}
```

-
-
-

Le routage

❖ Server :

```
[root@server ipv4]# more /proc/sys/net/ipv4/ip_forward  
0  
[root@server ipv4]#
```

✓ pour configurer routage non permanente

```
[root@server ipv4]# echo 1 > /proc/sys/net/ipv4/ip_forward  
[root@server ipv4]# more /proc/sys/net/ipv4/ip_forward  
1  
[root@server ipv4]#
```

- ✓ pour activer le routage d'une maniere permanente ouvrir le fichier /etc/sysctl.conf et modifier la variable **net.ipv4.ip_forward** (mettre la valeur 1)

➤ avant la modification :

```
[root@server ~]# gedit /etc/sysctl.conf  
  
# Kernel sysctl configuration file for Red Hat Linux  
#  
# For binary values, 0 is disabled, 1 is enabled. See sysctl(8) and  
# sysctl.conf(5) for more details.  
  
# Controls IP packet forwarding  
net.ipv4.ip_forward = 0
```

```
# Controls source route verification  
net.ipv4.conf.default.rp_filter = 1  
. .
```

➤ après la modification :

```
[root@server ~]# gedit /etc/sysctl.conf
```

```
# Kernel sysctl configuration file for Red Hat Linux
#
# For binary values, 0 is disabled, 1 is enabled. See sysctl(8) and
# sysctl.conf(5) for more details.

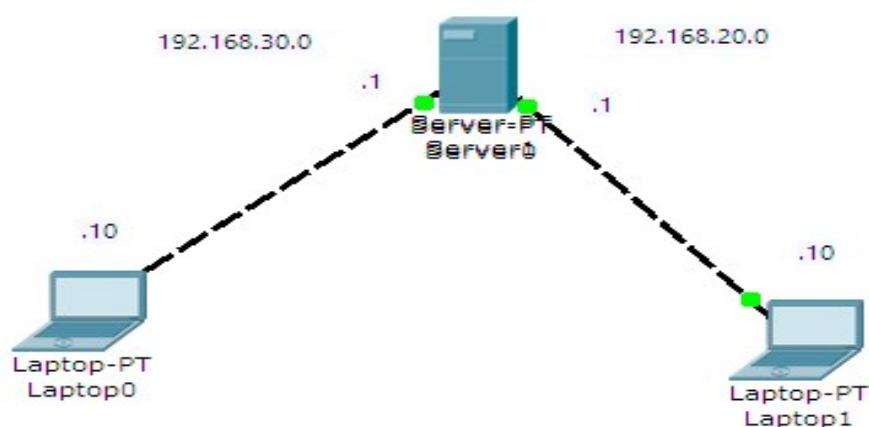

# Controls IP packet forwarding
net.ipv4.ip_forward = 1

# Controls source route verification
net.ipv4.conf.default.rp_filter = 1

.
```

Resumer :

- ✓ routage permanent :

```
[youna@server ~]$ su -
Password:
[root@server ~]# gedit /etc/sys
sysconfig/ sysctl.conf syslog.conf
[root@server ~]# gedit /etc/sysctl.conf
[root@server ~]# cat /proc/sys/net/ipv4/ip_forward
0
[root@server ~]# echo 1 > /proc/sys/net/ipv4/ip_forward
[root@server ~]# cat /proc/sys/net/ipv4/ip_forward
1
[root@server ~]# more /proc/sys/net/ipv4/ip_forward
[root@server ~]# gedit /etc/sysctl.conf
```

For binary values, 0 is disabled, 1 is enabled. See sysctl(8) and
sysctl.conf(5) for more details.

Controls IP packet forwarding

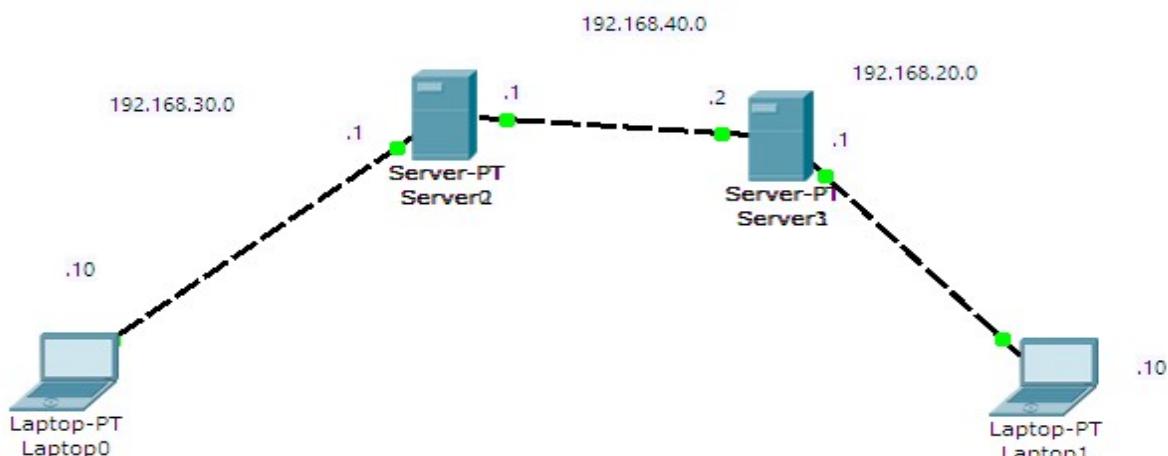

net.ipv4.ip_forward = 1

Controls source route verification

01/04/2013

✓ **Routage statique :**

- ❖ **Server1 :**
- ❖ **Server2 :**

```
[youna@server ~]$ su -
Password:
[root@server ~]# gedit /etc/sys
sysconfig/ sysctl.conf syslog.conf
[root@server ~]# gedit /etc/sysctl.conf
[root@server ~]# cat /proc/sys/net/ipv4/ip_forward
0
[root@server ~]# echo 1 > /proc/sys/net/ipv4/ip_forward
[root@server ~]# cat /proc/sys/net/ipv4/ip_forward
1
[root@server ~]# more /proc/sys/net/ipv4/ip_forward
[root@server ~]# gedit /etc/sysctl.conf
```

For binary values, 0 is disabled, 1 is enabled. See sysctl(8) and
sysctl.conf(5) for more details.

Controls IP packet forwarding
net.ipv4.ip_forward = 1

Controls source route verification

- ❖ **Server1**
- **Ajouter une route statique :**

```
[root@server ~]# route add -net 192.168.20.0 netmask 255.255.255.0 gw 192.168.40.2
```

- ❖ **Server2:**

```
[root@server2 ~]# route add -net 192.168.30.0 netmask 255.255.255.0 gw 192.168.40.1
```

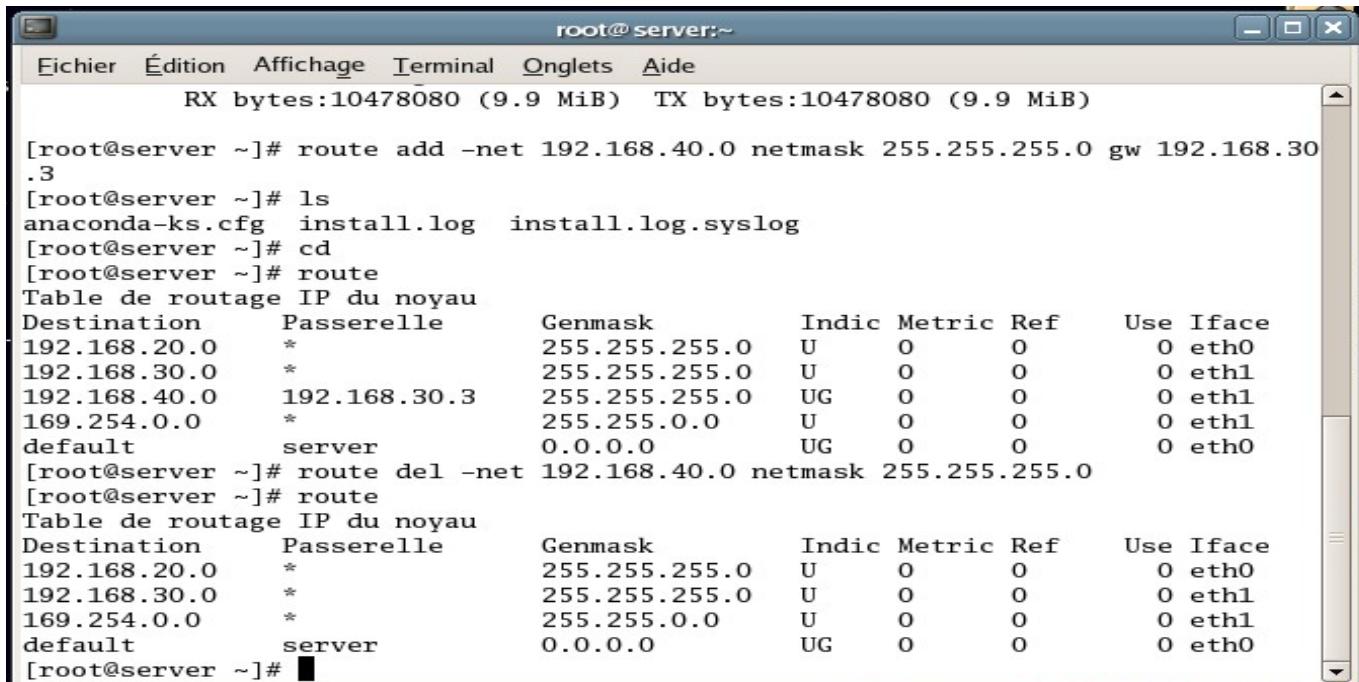

- **Supprimer une route statique “sur le deux machine” :**

```
[root@server2 ~]# route del -net 192.168.30.0 netmask 255.255.255.0
```

- **Afficher la table de routage:**

```
[root@server2 ~]# route
```

❖ Example:

The screenshot shows a terminal window titled "root@server:~". The window has a menu bar with "Fichier", "Édition", "Affichage", "Terminal", "Onglets", and "Aide". Below the menu, it says "RX bytes:10478080 (9.9 MiB) TX bytes:10478080 (9.9 MiB)". The terminal content is as follows:

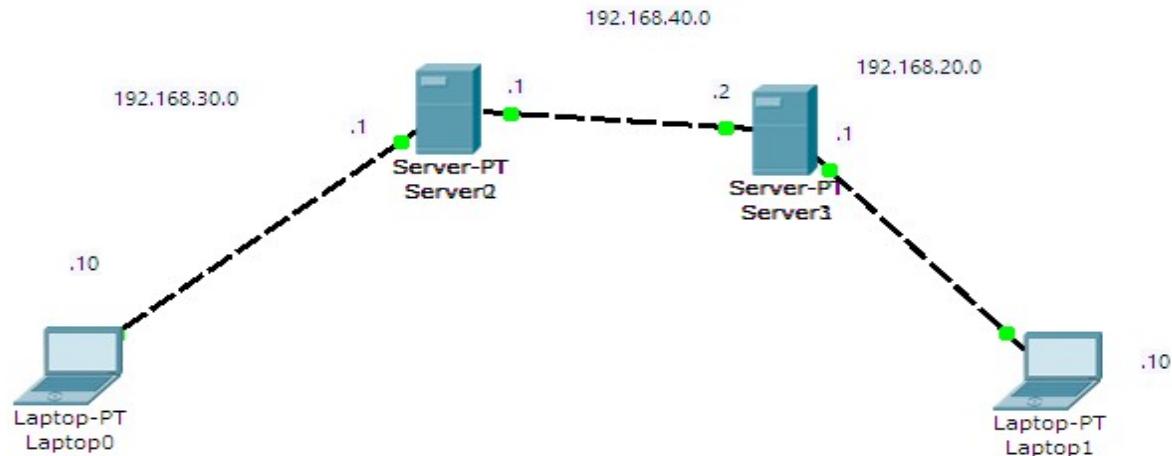

```
[root@server ~]# route add -net 192.168.40.0 netmask 255.255.255.0 gw 192.168.30.3
[root@server ~]# ls
anaconda-ks.cfg  install.log  install.log.syslog
[root@server ~]# cd
[root@server ~]# route
Table de routage IP du noyau
Destination     Passerelle      Genmask        Indic Metric Ref    Use Iface
192.168.20.0   *              255.255.255.0  U     0      0        0 eth0
192.168.30.0   *              255.255.255.0  U     0      0        0 eth1
192.168.40.0   192.168.30.3  255.255.255.0  UG    0      0        0 eth1
169.254.0.0    *              255.255.0.0   U     0      0        0 eth1
default        server          0.0.0.0       UG    0      0        0 eth0
[root@server ~]# route del -net 192.168.40.0 netmask 255.255.255.0
[root@server ~]# route
Table de routage IP du noyau
Destination     Passerelle      Genmask        Indic Metric Ref    Use Iface
192.168.20.0   *              255.255.255.0  U     0      0        0 eth0
192.168.30.0   *              255.255.255.0  U     0      0        0 eth1
169.254.0.0    *              255.255.0.0   U     0      0        0 eth1
default        server          0.0.0.0       UG    0      0        0 eth0
[root@server ~]#
```

✓ Routage dynamique :

Pour configurer le routage dynamique . on doit installer le package :

“quagga-0.98.3-2.i386.rpm “

```
[root@server ]# cd /media/cdrom/Fedora/RPMS
[root@server RPMS]# find qua*
quagga-0.98.3-2.i386.rpm
quagga-contrib-0.98.3-2.i386.rpm
quagga-devel-0.98.3-2.i386.rpm
[root@server RPMS]# rpm -ivh quagga-0.98.3-2.i386.rpm
attention: quagga-0.98.3-2.i386.rpm: Entête signature V3 DSA: NOKEY, key ID
4f2a6fd2
Préparation...          ##### [100%]
1:quagga             ##### [100%]
[root@server RPMS]#
```

Pour configurer le fichier [**/etc/quagga/zebra.conf**](#)

[root@server]# more /etc/quagga/zebra.conf

```
{ hostname { nom-serveur
{ password { mot-de – passe}
```

✓ **Example :**

[root@server]# gedit /etc/quagga/zebra.conf

```
hostname server
password pa$$word
```

➤ **pour configurer le protocole de routage Rip :**

créer le fichier de configurtion [**/etc/quagga/ripd.conf**](#)

[root@server]# touch /etc/quagga/ripd.conf

configuration

[root@server]# gedit /etc/quagga/ripd.conf

```
hostname server
password pa$$word
```

➤ pour configurer le protocole de routage ospf :

créer le fichier de configuration **/etc/quagga/ospfd.conf**

```
[root@server ]# touch /etc/quagga/ospfd.conf
```

configuration

```
[root@server ]# gedit /etc/quagga/ospfd.conf
```

```
hostname server  
password pa$$word
```

➤ ***service telnet :***

- ✓ installer le package **xinetd** :

```
[root@server ]# cd /media/cdrom/Fedora/RPMS  
[root@server RPMS]# find xinetd*  
xinetd-2.3.13-6.i386.rpm  
[root@server RPMS]# rpm -ivh xinetd-2.3.13-6.i386.rpm  
attention: xinetd-2.3.13-6.i386.rpm: Entête signature V3 DSA: NOKEY, key ID  
4f2a6fd2  
Préparation... ##### [100%]  
1:xinetd ##### [100%]  
[root@server RPMS]#
```

- ✓ Installer le package “ **telnet-server** “:

```
[root@server ]# cd /media/cdrom/Fedora/RPMS  
[root@server RPMS]# find telnet-server *  
telnet-server-0.17-35.i386.rpm  
[root@server RPMS]# rpm -ivh telnet-server-0.17-35.i386.rpm  
attention: telnet-server-0.17-35.i386.rpm: Entête signature V3 DSA: NOKEY, key ID  
4f2a6fd2  
Préparation... ##### [100%]  
1:telnet-server ##### [100%]  
[root@server RPMS]#
```

✓ modifier le fichier /etc/xinetd.d/telnet

Modifier le fichier /etc/xinetd.d/telnet , (on ajoute la ligne “ port = 23 “ et modifier le parametre disable , on met “ no “)

```
# default: on
# description: The telnet server serves telnet
sessions; it uses \
#       unencrypted username/password
pairs for authentication.
service telnet
{
    flags          = REUSE
    socket_type   = stream
    wait           = no
    user           = root
    server         =
/usr/sbin/in.telnetd
    log_on_failure += USERID
    disable        = yes
}
```

```
# default: on
# description: The telnet server serves telnet sessions; it #
uses \
#       unencrypted username/password pairs for
authentication.
service telnet
{
    flags          = REUSE
    socket_type   = stream
    wait           = no
    user           = root
    server         = /usr/sbin/in.telnetd
    log_on_failure += USERID
    disable        = no
    port           = 23
}
```

❖ Ajouter un utilisateur avec un mot de passe :

```
[root@server ]# useradd -m sara
[root@server ]# passwd sara
Changing password for user sara.
New UNIX password:
BAD PASSWORD: it is based on a dictionary word
Retype new UNIX password:
passwd: all authentication tokens updated successfully.
[root@server ]#
```

❖ démarrer le service xinetd :

```
[root@server RPMS]# service xinetd start
Démarrage de xinetd : [ OK ]
[root@server RPMS]#
```

❖ tester l'accer depuis une machine client :

```
[youna@server2 ~]$ telnet
telnet> open 192.168.30.2
Trying 192.168.30.2...
Connected to 192.168.30.2 (192.168.30.2).
Fedora Core release 4 (Stentz)
Kernel 2.6.11-1.1369_FC4 on an i686
login: sara
Password:
Last login: Tue Mar 19 22:24:13 from 192.168.30.3
[sara@server2 ~]$ mkdir zhour younes omar abdo
```

192.168.30.2 => l'adresse de servuer

❖ Pour fermer la session

```
[u1@server2 ~]$exit
```

verfier la création des rep “ zhour younra “ a partir le serveur :

Méthode 1 :

```
[youna@server ~]$ su - u1  
Password:  
[u1@server ~]$ ls  
zhour younes omar abdo  
[sara@server ~]$
```

Méthode 2 :

```
[root@server RPMS]# ls /home/u1  
zhour younes omar abdo  
[root@server~ ]#
```

résumer la configuration de rip :

✓ sur R1 et R2 :

❖ Server1
❖ Server2

- installer xinetd et telnet-server
- installer quoagga
- création fichier de configuration ripd.conf
- demarrer xinetd , zebra et ripd
- configurer le routage rip taper la commande :

telnet 127.0.0.1 2602

ou

telnet 172.0.0.1 ripd

- configurer les deux routeurs

```
[root@server RPMS]# cd /media/cdrom/Fedora/RPMS
[root@server RPMS]# rpm -ivh quagga-0.98.3-2.i386.rpm
attention: quagga-0.98.3-2.i386.rpm: Entête signature V3 DSA: NOKEY, key ID 4f2a6fd2
Préparation...          ##### [100%]
 1:quagga             ##### [100%]
[root@server RPMS]# gedit /etc/quagga/ripd.conf
```

```
hostname server
password pa$$word
```

```
[root@server RPMS]# rpm -ivh xinetd-2.3.13-6.i386.rpm
attention: xinetd-2.3.13-6.i386.rpm: Entête signature V3 DSA: NOKEY, key ID 4f2a6fd2
